

# Deep Linking in tvOS

Session 246

Paul Schneider, tvOS Engineer

# What is a Deep Link?

A URL referring to content that your application can display

The content is often several steps away from your app's main screen ("deep" in the navigation hierarchy)

The link jumps the user directly to the content

# Where Do Deep Links Come From?

Your top shelf extension is a likely source of deep link requests

The same logic can be used to handle link requests from any application

Top Movies

# Use Universal Links

Allows parity with your iOS apps

Ensures that the link is routed to your application

Ensures that your app is expecting to handle the URL

<https://developer.apple.com/library/content/documentation/General/Conceptual/AppSearch/UniversalLinks.html>

# Handling Deep Links Gracefully

Configure the `ViewController` hierarchy to cleanly display the URL content

Present the UI without flashes or transitions

Make sure that Menu takes the user to a predictable place

# Two Top Shelf Item URLs

The displayURL is opened with the Select button

- Respond by presenting a detail page for the item

The playURL is opened with the Play button

- Respond by starting video playback

# Recommended displayURL Handling

Opening a displayURL should show a detail page

Pressing Menu should return to the app's initial screen

Pressing Menu again should return to the home screen

MENU

# Recommended playURL Handling

Opening a playURL should begin playing the video

Video should fade in from black

Pressing Menu should return to the video's detail page

Pressing Menu again should return to the app's initial screen

Pressing Menu a third time should return to the home screen
